I'll build this for you. This is a substantial research + build task, so let me set up a plan and get the verification work running in parallel before assembling the interactive widget.

☰ Creating the project plan >

Let me first compile the master candidate list, then verify them in parallel. I'll build the list from the seed plus targeted expansions.

🔗 Writing to candidates.txt >

This list has duplicates and overlap. Let me clean it into a deduplicated set of distinct destinations and split by whether browser verification is needed. Given the volume (well over 20 entities) and that each needs a live page visit, I'll use `wide_browse` — but first let me confirm with you since it consumes significant credits.

Let me build a clean, deduplicated entity list with precise verification instructions per
